SUMMARY

CS student operating a live SSH honeypot across **150,000+** real attacker sessions and maintaining production deployment infrastructure for **2,160 students**. Focused on systems security, Go, and infrastructure engineering.

EDUCATION

Manipal University Jaipur

B.Tech, Computer Science & Engineering | CGPA: 8.06

Jaipur, India

2024 – 2028

EXPERIENCE

DevOps Intern

Aug 2025 – Present

Software Development Centre, MUJ

Jaipur, India

- Identified and patched **CVE-2025-55182** (CVSS 10.0, critical — unauthenticated RCE in React Server Components) across **8 production services** within **24 hours** of disclosure; hardened all Docker images to non-root execution during the same rollout.
- Restructured Dockerfiles and authored incremental **GitHub Actions** build workflows across **45 repositories** — reduced image sizes by up to **82%** (2 GB → 358 MB) and **79%** (786 MB → 164 MB), cutting registry storage and deployment times across the CI/CD fleet.
- Deployed **Tailscale** Zero Trust mesh across Hostinger and bare-metal nodes, eliminating all public SSH exposure; enforced kernel-level resource governance via **cgroups** across the containerized production fleet to prevent resource contention across co-located services.
- Maintain deployment infrastructure for **3 production academic platforms** (NPTEL certificate verification, Elective Management System, IT ticketing) serving **2,160 CSE students** at Manipal University Jaipur across 45 repositories.

PROJECTS

MIRAGE | Production SSH Honeypot & Threat Intelligence Platform | Go • PostgreSQL • Docker • Cloudflare

[Live](#)

- Deployed an internet-facing SSH honeypot capturing **150,000+ real attacker sessions**; engineered from scratch in **Go** with a custom TCP listener, SSH handshake via golang.org/x/crypto/ssh, and a stateful fake shell supporting pipes, redirects, command chaining, `$(...)` substitution, and `~` path expansion.
- Hardened the platform under live traffic — fixed a `/metrics` auth bypass, a session-state race across concurrent SSH channels, and an exec-payload deadlock — and built observability with **Prometheus/Grafana** dashboards-as-code and verified offsite-backed daily DB snapshots.
- Identified coordinated botnet behavior via **SQL CTE clustering** — 13 IPs hitting at exactly 1,522 or 761 sessions each — and Solana-validator credential targeting across automated scanners; published findings as structured threat intelligence via `/api/export` endpoints and automated **GitHub Actions** CI.
- Dataset cited by **Dr. Johannes Ullrich** (Dean of Research, SANS Technology Institute) in the **SANSFire 2026** keynote “Skynet 1.0: Trust Us, It May Not Actually Kill You”.

NovaForge | Multi-Factor Approval & Audit Platform | Node.js • TypeScript • Prisma • React Tally CodeBrewers — Finalist

- Built **WebAuthn** passkey login with TOTP fallback and script-hashed recovery codes gated behind a fresh passkey signature; designed trust-decay sessions with immediate per-request revocation in place of hard expiry.
- Engineered an M-of-N / role-based / weighted-quorum approval-policy engine with escalation timeouts and fail-closed fallback, backed by a hash-chained, tamper-evident audit log with non-repudiable WebAuthn-signed votes.

MUJ Placement Kite | Placement Cell Platform | Go • PostgreSQL • Redis • Cloudinary

- Built the student module end-to-end (profiles, draft-request approval workflow, RBAC, rate limiting, Cloudinary document uploads) and an idempotent bulk-upload pipeline that generically parses UG/PG Excel templates.
- Designed audit logging across **12 write paths** and placement-cycle hiring-workflow tracking (round pass/fail, roster + Excel export); built an SMTP worker pool over **Redis Streams** for async mail delivery.

OPEN SOURCE

Honeynet Project | EventHorizon | github.com/honeynet/eventhorizon

- Added real-time attacker input capture to the **Telnet tarpit** in **C** and extended the **Go** Prometheus exporter with per-session behavioral metrics; PR merged to main by Honeynet maintainers.

TECHNICAL SKILLS

Languages: Go, Python, Bash, TypeScript, C, Java

Frameworks & Tools: FastAPI, Next.js, Docker, Caddy, Git, GitHub Actions, Ollama, sentence-transformers

DevOps & Infrastructure: Docker Compose, Cloudflare, Tailscale, Prometheus, Grafana, MinIO, Linux

Databases: PostgreSQL, Redis, MongoDB, SQLite, Supabase
